Third-party vascular supplies and outcomes after distal pancreatectomy: a single-center, population-based analysis. The impact of the quality of vascular supplies on outcomes after pancreatic resection is unknown. We aimed to describe outcomes after distal pancreatectomy for benign and malignant neoplasms using a population-based cohort. Consecutive patients who underwent distal pancreatectomy between January 2012 and June 2015 in a single, urban, tertiary referral center were identified from the hospital's prospectively maintained database. Third-party vascular supply was defined as the presence of arterial or venous graft, including artery or vein bypass or the use of umbilical arteries or veins. Primary outcome measures were postoperative complications and 30-day readmissions. Multivariable logistic regression models adjusted for baseline differences in patient characteristics and treatment were used to estimate odds ratios. Two hundred thirty-three patients were identified. Vascular supply was available in 118 patients (50%). Median age was 58 years (interquartile range, 50-69 years), and 27% were women. Thirty-day readmissions occurred in 12% of patients. The most frequent complications were pneumonia (12%), gastrointestinal (8%), urinary (7%), surgical (6%), and surgical-wound (3%). Univariate analyses revealed no significant difference in complication rate or 30-day readmission rate between patients with and without vascular supply. However, vascular supply was independently associated with a 3.7-fold increase in the odds of experiencing any complication (odds ratio [OR], 3.7; 95% CI, 1.6-8.8; $P = .002$) and a 2.1-fold increase in the odds of 30-day readmission (OR, 2.1; 95% CI, 1.0-4.6; $P = .051$). The presence of a third-party vascular supply was independently associated with a 3.7-fold increase in the odds of experiencing any complication after distal pancreatectomy and a 2.1-fold increase in the odds of experiencing a 30-day readmission. The use of a third-party vascular supply should be incorporated into the preoperative evaluation of patients who are considering a distal pancreatectomy.
