Stomatal responses to hormones and to the application of foliar-applied growth regulators in oat leaf. Stomatal responses of oat (*Avena sativa* L.) leaves to application of either IAA, kinetin, kinetin + IAA, 2,4-dichlorophenoxyacetic acid (2,4-D) or gibberellic acid (GA3) were examined using light/dark vapour pressure deficit conditions. 2,4-D was the most effective in closing stomata. Lowering of stomatal conductance upon exposure of leaves to vapour of 2,4-D (+/-IAA) indicated that IAA may increase stomatal opening. IAA was the only hormone or growth regulator which made stomata remain open at high vapour pressure deficit and was the only hormone which, in conjunction with kinetin, opened stomata in darkness. The actions of other hormones were not consistent with their reported physiological actions. No changes were observed in stomatal conductance when leaves were treated with kinetin alone or in combination with either IAA or 2,4-D. The results of growth of second leaves of oat seedlings produced by application of hormones to the first leaves are presented, showing that kinetin is the most effective in stimulating plant growth. This is the main board on The Outhouse, where Outhousers talk about everything. No topics are off limits, and it doesn't have to be about comics. All the topics from the other boards also show up in The Asylum, so you never have to leave! I came across this a while ago and thought it was pretty interesting, I thought it would be good to show the recent development of the page, as well as what was the initial drawing that went with it, this was followed by some minor changes until final form. so I would like to thank Douglas Rosenthal and Mr. Saddleberry for giving us this permission to use their scans in a mod for this site. This is an early draft of the pages I did for issue #2. let me know what you think.
