## **Look Alive Free Download**

This is an application to tell you if a host is reachable (aside from maybe having an unreachable IP) Current Version: 1.0.0.0 Current Release Status: Alpha Developed By: Spitfires & Space Goats Contact Information: [lookalive@spitfires.net](mailto:lookalive@spitfires.net) Look Alive Readme.txt: There are two readme files. One is in the Look Alive folder, the other in the Make a Look Alive icon folder. Functional Overview: Look Alive is an application that sits in the system tray displaying the results of a ping request to a remote host. If no internet connection exists, Look Alive will never display an icon and will be run in an infinite loop with no further arguments. If an internet connection exists, Look Alive will provide status indicators based on the results returned by a ping request to the remote host. If the remote host is reachable, the icon will display a tick mark. If the remote host is unreachable, the icon will display a question mark. Possible future developments include displaying the answer to a ping request. Other possible future developments include providing a graph showing the ping request results over time. The functions of the application are as follows: On Application Startup: Look Alive will start up, or be displayed in the system tray, displaying the results of a ping request to a remote host. The name or IP of the remote host can be specified on startup, in which case, Look Alive will not display an icon on startup. In this state, Look Alive will repeatedly perform a ping request to a remote host,

---

displaying the results of the ping request in the system tray. If no internet connection exists at the remote host, the process will exit after a few hours and be run in an infinite loop with no further arguments. If a connection exists, the application will pester the remote host until the connection times out. If a remote host is listed in the list of hosts on startup, the application will perform a ping request against that host, displaying the results of the ping request in the system tray. If the remote host is unreachable, Look Alive will display an icon in the system tray that will not be removed until the remote host becomes contactable. If the remote host is reachable, the application will display an icon in the system tray that will not be removed until the remote host becomes unreachable. If

### What's New in the?

Have you ever checked the connection status of a machine? You can use the ping command, which is part of the Windows OS. Or you can use Look Alive, which is a small, simple application that reflects the results of a ping request as an icon in the system tray. It's useful for monitoring remote hosts (especially for firewalls). You can also use it to check the connection status of a PC when you can't get to it. Why not visit the site: How Look Alive works: It sends a ping request to the remote host you specify as an argument, and checks the results. If there's a connection, Look Alive displays a green "L" icon in the system tray. If there's a problem with the connection, an "X" icon will be displayed. It also works with IPv6 addresses, as well as hostnames (but no port numbers or file extensions).

---

Screenshots: Just go to my site to download the instructions,.exe, and screenshots. Screenshot 1: Screenshot 2: How to install: To install, you just extract the contents of the.zip file to some convenient location, for example: C:\ping (or some other folder on your C drive) Copy the.exe file to a convenient location on your system, like C:\ping You'll now be able to launch Look Alive whenever you like. To do this, just put a valid hostname or IP address in the argument field, for example: "lookalive.exe www.google.com" If you don't provide an argument, Look Alive will check the connection status of the local system as the first step. If Look Alive is not showing the L or X icons, it could be a firewall problem. If you've tried to install Look Alive, and you see any error messages in the log file, just try to copy the.exe file again. Or if you are dealing with a firewall problem, go to your firewall program of choice, and try to open port 137 (DNS) or port 53 (TCP) – usually, you won't need to change any settings, just try to open the port. You'll be able to see Look Alive's icon in the system tray, and you can check if the remote
