Students of mechanical engineering have to learn the essentials of basic concepts of mechanics. The course continues with the introduction of mechanics of materials. The students are introduced to basic concepts of friction, rigid bodies, and elastic bodies and various types of structures with rational

analysis. The students learn about various types of machines and their functioning such as air compressors, air conditioners, jet engines, and piston air compressors. They learn that an understanding of the principles of mechanics is very essential to design and produce effective mechanical devices. Other topics discussed in the same course are applicable machines and their

applications, forces and moments, stresses, stress distribution, and strains. In addition, the students learn about control systems, structural dynamics, centrifuges, and frequency response.
